

# REAR OUTER BEARING KIT

PT NO. AWR-7250

---

This kit includes:

- 2 complete bearing kits
- Offset washers

**INSTALLATION:** The bearing kits replace the rear control arm outer bushing. The purpose of this item is to eliminate binding in the rear suspension that may be caused by increasing or decreasing camber from factory settings or just lowering the cars platform. The carrier shells for this item must be tack welded in place after installation of the unit into the control arm. Install the shell with the bearing and then install the outer shell and clamp together, then tack weld in place. You should remove any paint from around the area before welding and you may also need to barrel sand the sleeve of the arm before installation.

We have supplied offset washers to install into the eccentric locations, which you may decide to use or omit from your set up. We prefer to use these and keep this point as a constant setting for our suspension settings.
